Languages on the edge: from private archive to shared library

Mohomoudou Rousouba

Rethinking the library

The ISH, a descendant of the Institut Français d’Afrique Noire (IFAN), founded in 1936, holds a rich repository of written documents, but also voice and sound recordings from the colonial era onwards. The material is strong in history and social anthropology as well as in oral tradition recorded in different linguistic and cultural regions. Of the three research departments at ISH, the Department of Linguistics and Oral Literature was established with the mission to coordinate and harmonize research on local knowledge and the medium in which it is transmitted, preserved, and transformed. Still, the process has been neither systematic nor sustained. Moreover, frequent moves have forced the ISH Direction to stow away a significant part of its documents. The ISH relocated to a permanent site in 2017, and the three departments are only now recovering their archives. With regard to the language archives, though, the inventory of the scattered documents started before HAB, its completion and integration into a larger curriculum of training, knowledge production and dissemination has been accelerated through our exchanges around the activities to be undertaken for the language and translation theme of the HAB program.

The next phase in the program is the training of students to digitize priority content and make it accessible to the research community. Part of the planning was done during my visit to the ISH in September 2017. I had brought along samples of private archives, some thirty years old, others quite recent, that I had been sorting out for digitization, transcription and translation. As it turned out, the physical presence of both the material and the portable equipment I had brought stimulated a productive discussion on the best way to move ahead, even if step by step and with limited resources. For that matter, the ISH and similar institutions have recently seen their research budgets drastically reduced or cancelled altogether. The drying up of research funding is officially blamed on increased spending on military and security efforts, but the humanities have in fact always been doing so with scarce resources. For the ISH department in charge of revitalizing language research, these sudden cuts have made planning even more difficult, at a crucial juncture. Therefore, HAB has become on even more important platform to share experiences, especially with regard to enabling the co-production of new knowledge and teaching methods. To some extent, the institute’s hidden repository, just like my personal notebooks and tapes, belong to the category of private archives, shrouded in the intimacy of the inner circle, waiting to be part of a shared library that could be open to all in a new and potentially critical perspective on memories and representations of the past.

Floating family trees

Growing up in a farming village, I first experienced the seasons as alternating cycles of seemingly endless activity with short moments of rest. Of the latter, the end of the rice harvest season remains the most memorable, when, at the peak of the flood season, people traveled by pirogue to visit their relatives along the river. During this period, our house would fill up with visitors, who sometimes arrived from far away. I used to listen to my father retelling names after names, sometimes being interrupted with questions about a person or prompted for details about how this one was related to that one. My father also eagerly told us children about these kinship relations, but I did not have the attention span of his adult guests, often distant relatives, who listened closely to his accounts, engrossed in the intricate details of lineage spread over hundreds of kilometers, crisscrossing today’s national territory, even spilling across national borders. Nonetheless, I became aware early of the power of being able to retain such knowledge of ancestry: the capacity to remember so many names of persons and places, to recall historical events associated with individuals, families and communities, the narrative skills needed to pass on the stories in a precise and even entertaining manner.

Within the framework of the IIAS programme Humanities across Borders: Asia and Africa in the World (HAB), Mali is the site of investigation for language and translation practices with a special focus on opening and connecting ‘marginal libraries’, that is: the most modest collections of print, sound and film records that any individual or institution might possess. In this regard, both the archives of the host institution, Mali’s Institute of Humanities (ISH), and personal files come into play.

A need of narrative structure

My own fascination for the art and technique of such storytelling came later, though. Indeed, it took me years of living away from my home region and my family to gain a genuine interest in the stories with which I grew up. The first moment came in my third year at the teachers college in Bamako, when I spent part of my school holidays with my relatives in the old city of Gao, we used to attend the evening gatherings on the public square in our neighborhood. Amidst the large crowds of people, several storytellers took center stage, taking turn recounting different episodes of the history of Songhay and genealogical and historical accounts. Initially, I recalled a scene I had witnessed ten years before. In 1977, when I spent part of my school holidays with my relatives in the old city of Gao, we used to attend the evening gatherings on the public square in our neighborhood. Amidst the large crowds of people, several storytellers took center stage, taking turn recounting different episodes of the history of the city and the region. The physical scene fascinated me more than the mainstay of Songhay history about which I had already heard or read in fragments at home and school. For my college project, I decided to find a master storyteller who not only knew the intricacies of the past, but could also recount them in a compelling way. My search led me to a renowned oral historian in the old city of Gao, whom I recorded over one afternoon. I returned home with the tape, which I played before my father. He turned out to be both an engaged and skeptical listener, asking me several times to replay statements, commenting on what he found accurate, dubious, or far-fetched. I realized that in recounting the past the deeds of well-known historical figures were the most subject to discrepancies and controversy.

My father’s objections to some detail or other had a lot to do with how he identified with a given character in the story. The other’s account, at times, either displaced the centrality of our own lineage in the context of local history, or produced portraits that did not correspond to the image my father had of these ancestors. I came to the conclusion that there was no single story to be told and that an important task in my project could be to tease out the elements of empathy and self-identification, and, conversely, aversion and rejection that might drive the storytelling and shape the relationship between the narrator and the topic, object or figure of narration. This questioning also led me, in the second phase of my project, to record my own father so that I could listen to him in a different contact – detached, to some extent, from the immediate moment or familial context. Therefore, I returned to Bamako with the two narratives, one based on a linear account of the shared history that most people knew and shared in different forms and lengths, the other of a more personal and subjective nature as it started with and revolved around the origins of one family.

In the end, I changed my thesis topic altogether, yet I kept the tapes close to me and even brought them along as I attended a summer school in creative writing in Elkins, West Virginia, but aside from discovering different and lively traditions of declamation, especially from the Appalachian region, the course did not yield any practical use for my tapes. I was bound to carry them along to the different places where I would live between 1987 and 1999. They followed me to Niger for a year and to the American Midwest for ten years. For the most part, they ceased to be present in my consciousness.
Poetics of everyday life

Having transcribed and partially translated the recordings, I am now focusing on the intertexts of different narratives, recorded about familial and regional histories over the last three decades. The centrality of the Songhay empire in West African history and its global influence is well known, thanks to the chronicles and testimonials written by traveling scholars of the Arab-Islamic world. The library of the Twelfth Century, Timbuktu, Gao and Essouk, from the late Middle Ages to the colonial era and throughout the 20th century. More recent narratives help us supplement fragmentary and lacunose accounts, especially by shedding light on the practice of everyday life, giving insights into material culture as well as the development of diseases and remedies.

Reneued sense of urgency

When I rediscovered them again in full, ten years later, the recording of the oral historian was intact. It struck me then as the performance of a well-trained, routine performer. The speaker came across as a warm conversation partner, who, at times, provided the listener with an endless flow of storytelling to a wrong answer to one of his rhetorical questions. In all, he was an agile performer who enjoyed sharing his knowledge and establishing his authority as the master of the word. On the other hand, my father spoke in a neutral, metallic voice with hardly any interruptions, until the tape started to wear and disintegrate after thirty-two minutes. The rest of the tape was hardly audible. It came to an abrupt end, just when he was telling me about the situation in our village near Gao at the onset of the French colonial era. I seemed to have never truly grasped the content of the story, as before I had only focused on the form and style (prosody) of the story. I had been interested in the strategies used to remember such complex details, to keep a narrative going with hundreds of names, events and places, spanning different centuries and regions. The brutal interruption in the story, when my father reflected on the fundamental shift that had occurred in local genealogy, ancestry and the nature of social bonds, motivated me to make up for the lost part. There were other points I had hardly noticed, and one unfulfilled promise still lingered with me. He had asked me to go see an alliging, elderly woman in our extended family in the old city of Gao, and ask her for more precise details about my mother’s side of the family, considered to be more deeply rooted in the area and related to key figures of the past. To be sure, as I started my seventh year in the Midwest, listening to the distant voices of my father and his contemporary prompted me to sense a urgency of which I had never felt before in relation to the long, fragmented and variegated story of the Songhay-speaking people and their heartland between Djenne and Niamey; the cycles of being a dominating power and a cluster of subjugated dominions; the dramatic end of their empire with the Moroccan invasion in 1991; the collapse of the last major regional states, which marked the irreversible shift of power to the Saharan desert routes to the Atlantic ocean; the rise of imperial and colonial power; the transatlantic slave trade to settle and exploit the Americas with free African labor, which had the industrialization of the West and prepared for the colonial era, which the African continent has yet to exit.

In 1979, as I delved into slave narratives for my dissertation on the discourse on the African diaspora, it became clear to me that one day, the oral fragments I had recorded could help substantiate part of a narrative that could neither be linear nor complete. Like American slave narratives, the stories of the West African past are permeated by traces of displacement, bondage, longing for freedom, and the destruction and reconstruction of a homeland. Nevertheless, they also convey a sense of wholeness and rootedness that is hard to associate with the transcendent experience of radical disruption. I decided to have my younger brother do a follow-up recording with our father. The 1997 recordings would last 320 minutes. I was not present at these sessions, but this made me all the more the narrator. Distance pulled me into the center of the story as my name was uttered every time my father decided to tell the genealogy from my generation to the most distant ancestor recorded in our lineage on his side and my mother’s.

Transcription: listening (more) closely to silence

More recently, transcribing the 1987 and 1997 recordings has enabled me to listen more carefully and deeply to the content of the tape. When I revisit the recordings, I find ways to connect between the narrative threads and specific details, including the scores of names repeated as the genealogy was recited in a concentric way: from the family to the village, from one village to the next, among related villages, and across whole regions. This way, we learned how, on his father’s side over three centuries ago, people left the Massina (Macina), 630 km to the south, migrated in stages northwards and settled in places in today’s regions of Mopti and Timbuktu before finally reaching Gao.

Dealing with the recordings has never been an easy task for me. On the one hand, they are intimate, private stories about the interwoven strands that constitute our family heritage. On the other hand, they also represent a shared story, as they retrace the lineage of thousands of people from the Mali-Niger border to the central region of Mali. From east to west, they cover at least 900 km and uncover the multi-ethnic roots of families like mine. For instance, my ancestors who left the Massina were Fulani. They went north and east, mingled with the Songhay, Tuareg and other populations they encountered along the way; yet, I relate my ethnic and linguistic identity today as Songhay. To be sure, even in my childhood, people occasionally referred to us as Fulani, because ‘technically’, our patrilineal side can be traced back to a faraway Fulani heartland, although my mother’s family is considered to be part of the indigenous Songhay stock of Gao. In fact, for a long time, my own representation of the recordings revolved around the genealogy, the part that connected me to my parents and made me part of a web of kinship, and especially my relation to people who today identify with a specific ethnic group, with its associated language, social culture, and worldview. However, as I resume working with the recordings, I realize that in my representation of the material itself, the genealogical part is in fact exaggerated. While it makes up about half of the audible part of the 1987 recording (56 out of 30 minutes), it ends after 25 minutes of the 320 minutes recorded in 1997. Given the overlaps in the rendering of family trees, the genealogical component is just about 30 minutes. The remaining 320 minutes cover other topics; recently, these have become more relevant, motivating my effort to transcribe and translate the material in full.

From genealogy to general history

The genealogist is the guardian of oral traditions. From genealogy to general history, the part that is in fact exaggerated. While it makes up about half of the audible part of the 1987 recording (56 out of 30 minutes), it ends after 25 minutes of the 320 minutes recorded in 1997.
